**Systemic lupus erythematosus (SLE) is a complex autoimmune disease in which the body's immune system mistakenly attacks healthy tissue. It can affect the skin, joints, kidneys, brain and other organs. We report the case of a 7-year-old female patient with facial lesions of SLE since the age of 5. There was no significant family history and patient had been a healthy child from birth. The child presented with a malar rash, also known as a butterfly rash, with distribution over the cheeks but sparing the nasal bridge. This case represents the efficacy of the Dr. Michaels® (Soratinex®) product family in the successful resolution of facial lesions of SLE.**
